17 March 2021

Packages

```
library(tidyverse)
library(mosaicData)
```

Exercises

1.

?Whickham

Your answer: The data is observational as the description states that is based on age, smoking, and mortality, which are all observable events and not produced via experiments.

2.

nrow(Whickham)

```
## [1] 1314
```

Your answer; there are 1,314 observations. as we know every raw is an observations.

3.

names (Whickham)

```
## [1] "outcome" "smoker" "age"
```

Your answer: There are 3 variables, "outcome" "smoker", and "age"

unique(Whickham\$outcome)

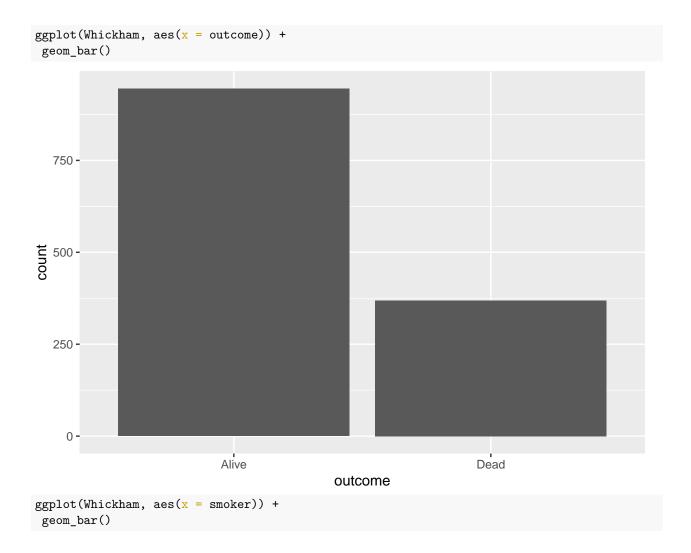

```
## [1] Alive Dead
## Levels: Alive Dead
```

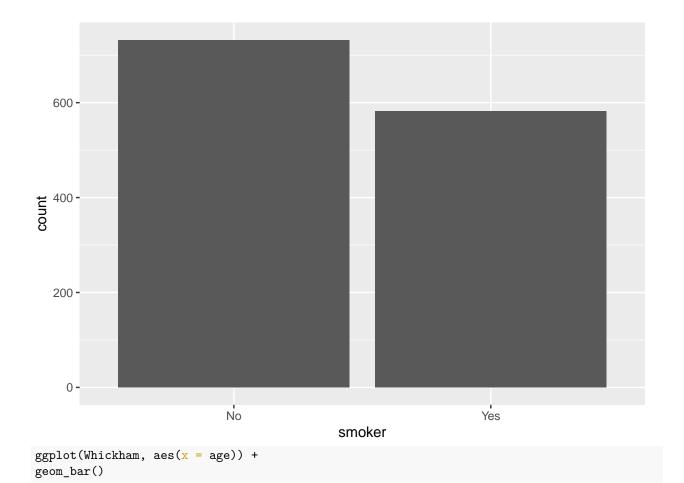

unique(Whickham\$smoker)

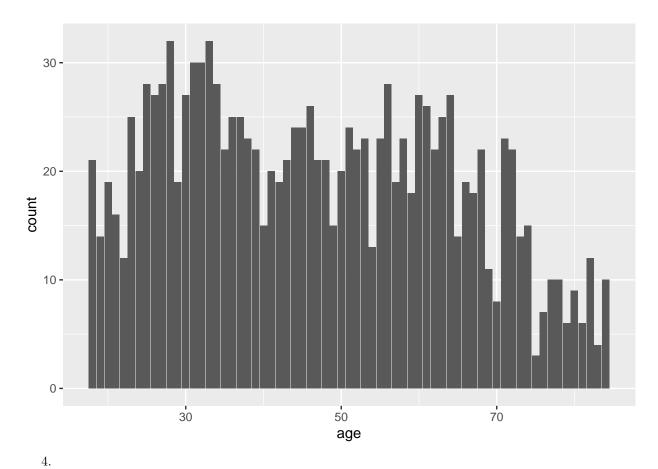

```
## [1] Yes No
## Levels: No Yes
unique(Whickham$age)
```

```
## [1] 23 18 71 67 64 38 45 76 28 27 34 20 72 48 66 30 33 68 61 43 47 22 39 80 59 ## [26] 56 62 51 32 60 37 36 50 55 73 52 25 53 31 54 69 79 75 21 29 24 26 49 84 40 ## [51] 44 74 46 35 77 57 42 81 19 63 78 83 82 70 58 41 65
```

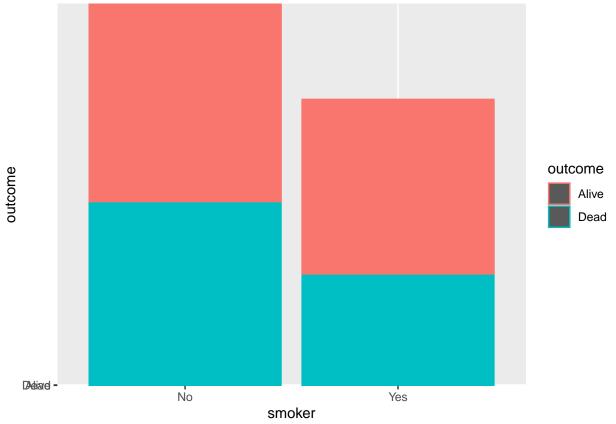

Your answer: Using the unique() function on the 3 variables we could see that "outcome" only takes Alive or Dead value, which makes it categorical non-ordinal. "smoker" only takes Yes or No, which also makes it categorical non-ordinal. Age is numerical continous data.

ggplot(data=Whickham, aes(x=smoker, y=outcome, color=outcome)) + geom_bar(stat="identity")

Answer; if smokers continue this way, they will develop many diseases that lead to death.

Knit, commit, and push to github.

5.

```
Whickham %>%
  count(smoker, outcome)
## smoker outcome n
```

```
## 1 No Alive 502
## 2 No Dead 230
## 3 Yes Alive 443
## 4 Yes Dead 139
```

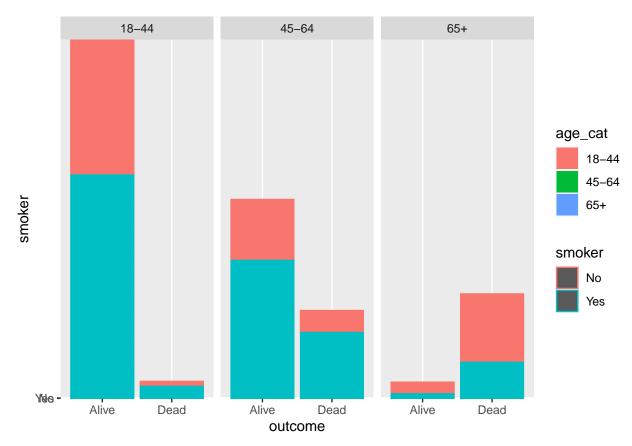

Answer; smoker no (732): 31,4 (dead) » (68,6) alive smoker yes (582): 23,8 (dead) » (76,2) alive. deaths from the non-smokers are also high.

6.

```
Whickham <- Whickham%>% mutate (age_cat = case_when (age <= 44 ~ "18-44", age > 44. & age <= 64 ~ "45-6")

7.

ggplot(data=Whickham, aes(x=outcome, y=smoker, color=smoker, fill=age_cat)) + geom_bar(stat="identity")
```

Knit, commit, and push to github.
